Introduction

The modern world required IT students to acquire educational resources which surpassed the capabilities of standard classroom instruction. The proposed website I had created was designed to support IT learners through real-time academic resource access and peer mentoring opportunities. The platform I had implemented included three fundamental features which helped students improve their learning experience.

The first feature I had designed included an interactive quiz module that enabled students to assess their understanding and receive immediate feedback. This helped them identify areas for improvement and strengthen their knowledge of key topics. The second feature I had developed provided tailored support packages for developing Portfolios of Evidence (POEs), offering structured guidance, templates, and relevant resources to assist in producing professional documentation. The online booking system functioned as the third feature I had built to establish an easy scheduling process for workshops and group study sessions and individual tutorials which minimized administrative work and enhanced academic support accessibility.

This document presented the planned website functions while showing how the design I had followed essential interaction principles which included consistency and learnability, and feedback mechanisms. The proposed platform I had constructed built an interactive online learning space through usability goals which included effectiveness and efficiency and user satisfaction to support IT students in their academic and professional development.

1.1 Detailed Functionality of the Website

The website design I had architected focused on delivering a straightforward navigation system which supported IT students by giving them continuous assistance throughout their educational period. The platform I had developed presented new users with a basic homepage which was

divided into two main sections for account **registration** and **login** access. The registration process I had designed required new users to provide their **Full Name** along with their **email address** and create a **password**. The system I had implemented verified user information after submission before sending an automated welcome email which contained a verification link to their address. The system I had created maintained user account verification through this procedure to guarantee absolute security of all existing accounts. Users gained entry to their accounts after they achieved successful verification through the use of their selected username and password. The website I had built allowed returning users who completed registration to access their accounts through homepage login without requiring them to verify their identity again.

Figure 1

The screenshot shows the 'Create an Account' form on the IT Learning Hub website. The form is centered on a light blue background. It has a title 'Create an Account' in purple. Below the title are four input fields: 'Full Name' with placeholder text 'Enter your full name', 'Email' with placeholder text 'Enter your email', 'Password' with placeholder text 'Create a password', and 'Confirm Password' with placeholder text 'Confirm your password'. Below these fields is a pink 'Sign Up' button. At the bottom of the form, there is a link: 'Already have an account? [Login](#)'. The website's header is a dark green bar with the logo 'IT Learning Hub' and navigation links: 'Dashboard', 'Quizzes', 'POE Support', 'Bookings', 'Forum', and a 'Logout' button. A vertical scrollbar is visible on the right side of the page.

Figure 2

The screenshot shows the 'Login to Your Account' form on the IT Learning Hub website. The form is centered on a light blue background. It has a title 'Login to Your Account' in purple. Below the title are two input fields: 'Email' with placeholder text 'Enter your email' and 'Password' with placeholder text 'Enter your password'. Below these fields is a pink 'Login' button. At the bottom of the form, there is a link: 'Don't have an account? [Sign up](#)'. The website's header is a dark green bar with the logo 'IT Learning Hub' and navigation links: 'Dashboard', 'Quizzes', 'POE Support', 'Bookings', 'Forum', and a 'Logout' button.

The website I had designed directed students to their individual dashboard which functioned as the main control hub of the platform. Students reached their **dashboard** to access three main system features I had implemented which included Quizzes and POE Support and Class Booking. A side navigation menu I had also created provided access to the Discussion Forum. The dashboard I had developed let students track their academic progress through its reminder system which also showed their pending schoolwork. The dashboard I had designed displayed students' academic progress through visual representation which helped them maintain their studies and stay organized.

Figure 3

When students accessed the **Quizzes** section I had built, they received multiple filtering options to select content based on subject area and module and difficulty level including Networking Basics. Once a selection was made, the quiz began. The quiz I had created contained multiple question formats which included multiple-choice questions and true/false statements and interactive coding exercises. The system I had implemented provided instant feedback after each question, including brief explanations for both correct and incorrect answers. This feature I had developed enabled students to maintain their learning activities while building their knowledge base. The system I had designed displayed a results page after quiz completion which showed the students' total score along with a performance chart that identified their strong points and weak areas.

Figure 4

Figure 5

Students who wished to work on their **Portfolio of Evidence (POE)** accessed the POE Support section I had created through the dashboard. The section I had developed provided step-by-step instructions with downloadable templates, and video tutorials which functioned as educational resources. A checklist I had also implemented was also available to help students confirm that all requirements had been met before submission. Students completed their POE by using the drag-and-drop tool I had built to upload their finished work. After a successful upload, the system I had designed displayed a “Submission Successful” message. This confirmed that their document had been securely stored.

Figure 6

Students needed to visit the **Book a Class** section I had created to obtain academic consultation services. The system I had implemented displayed an interactive calendar which presented all available time slots for booking. The students needed to pick their desired date and time while entering their consultation subject before they could finalize their booking. The system I had developed displayed a success message after confirmation and automatically sent an email to the student which contained all appointment details. The system I had designed displayed a fresh reminder on their dashboard to ensure they remembered all their scheduled sessions.

Topic of Consultation

What would you like to discuss?

Confirm Booking

Students could use the **Discussion Forum** I had built to exchange ideas with their fellow students and their instructors. The goal for this feature I had developed was to build a system which promoted communication between students and community oriented learning. Students had three options to find help through the Students Help Centre I had created they could explore current topics, search for specific discussions or start new posts to get their questions answered. The system I had implemented enabled users to receive notifications when other users replied to their messages which helped maintain active and quick discussion exchanges.

Figure 8

After completing their main activities such as finishing a quiz, uploading a POE, or booking a class students were returned to their dashboard, where they could either continue with another task or log out. When a user chose to log out, the system I had designed displayed a confirmation message and redirected them back to the homepage.

Overall, this website I had created was designed to provide students with a structured and logical learning experience that offered support at every stage from initial registration to final task completion. Each feature I had implemented was intended to make the process simple, interactive, and beneficial, ensuring that students could manage their academic responsibilities effectively while receiving timely guidance and feedback.

Figure 9

1.2.1 Usability Goals

Sharp, Rogers & Preece (2019) stated that usability is the process of making interactive goods simple to understand, efficient to use, and pleasurable for the user. It entails making the most of people's interactions with interactive products so they can perform their daily tasks at work, school, and other places (Sharp, Rogers & Preece, 2019). I changed the buttons for "Quizzes," "Bookings," and "Forum" from blue to red to make them more visible and effective for students, as shown in **Figure 5, 7 and 8**. Red color enhances visibility and draws attention to key actions, improving the overall user experience by helping students easily locate important features. It also conveys a sense of importance and urgency, encouraging engagement with these key sections. Additionally, using a consistent red color creates clear visual cues and supports accessibility for all users.

Effectiveness

Effectiveness was enhanced through more intuitive navigation and clearer visual feedback that increased task completion rates for quizzes and bookings. The goal I had set was to be effective by ensuring that all aspects of the system I had built generated correct and valuable outcomes. Every feature I had created was designed to assist users in reaching their educational objectives with precision and direction. As an illustration, when a user visited the Quiz area I had implemented and selected Networking Basics, as shown in **Figure 4**, the system promptly indicated if their responses were correct or wrong following each question. Upon finishing the evaluation, a performance graph and score overview were displayed, emphasizing their successes, strengths, and areas where further work was needed, as demonstrated in **Figure 5**. This method I had developed promoted ongoing education by allowing users to spot gaps in their knowledge early and build good study habits that boosted comprehension over time.

Efficiency

Efficiency improved with streamlined workflows and circular action buttons that reduced the steps needed to access key features. Efficiency was a principle I had implemented by creating procedures that reduced unnecessary actions and shortened the duration required to finish assignments. For example, when utilizing the Schedule a Meeting tool I had built, as illustrated in **Figure 7**, a user could easily pick an open time and verify their reservation with just a couple of fast clicks. The platform I had developed then displayed a verification message and sent an automated email alert. This straightforward layout I had designed saved effort and avoided aggravation by steering clear of difficult navigation. By prioritizing straightforward, easy-to-understand interactions, the goal I had was to develop a platform that enabled people to dedicate their attention to education instead of trying to learn how to operate the system.

Safety

Safety was strengthened through better error prevention and data protection measures that maintained user privacy and system integrity. The protection of academic data and error prevention received complete focus in the system I had architected to maintain safety standards. The system I had implemented verified login information through username and password verification while protecting personal details from unauthorized access, as shown in **Figure 2**. The system I had created alerted users when they entered wrong login information, but it kept their personal data safe from exposure. The system I had designed prevented students from making duplicate appointments by blocking off time slots that had already been booked in the booking system, visible in **Figure 7**. User data remained protected through this method I had developed while their schedule stayed up to date.

Utility

Utility increased with more practical resource organization and accessible support materials that directly addressed student needs. The website I had created was designed to focus on usefulness by adding features which served student needs. The support section I had built helped users during their Portfolio of Evidence (POE) work because they could download templates and follow the detailed instructions I had provided, as demonstrated in **Figure 6**. The ready-made resources I had implemented helped users complete their coursework directly, so they did not have to search for additional help.

Learnability

Learnability was supported by consistent design patterns and intuitive interfaces that reduced the learning curve for new users. The focus I had maintained was on creating an interface that assisted new users in learning the system. The system I had developed presented a brief tutorial after the initial login which demonstrated how to find quizzes, POE support, and class booking options, as shown in the tutorial overlay. The interface I had designed became user-friendly through the implementation of specific icons and precise labels, which eliminated the need for additional training.

Memorability

Memorability improved through distinctive visual cues and predictable navigation that helped returning users quickly regain proficiency. Design consistency was a principle I had implemented to help users remember information better. The dashboard layout together with the sidebar menu I had created appeared in the same place every time a user logged in so they could easily identify them, as illustrated in **Figure 3**. The system I had built remained familiar so users could find what they needed without any problems after a break from using it.

1.2.2 Desirable Aspects of User Experience

Satzinger, Jackson, and Burd (2016) argued that a customer's or user's whole experience dealing with a system, product, or service is referred to as user experience, or UX for short. Ease of use, accessibility, visual design, user interface features, and the emotional impact of using the product are all factors that UX considers when evaluating a product or service (Sharp, Rogers & Preece, 2019). The teal navigation bar improved visual hierarchy and brand identity, while circular buttons enhanced interactivity. Card layouts with animations boosted aesthetics, resulting in a polished, responsive interface that effectively engages students.

Satisfying

The results of the user experience improvements I had implemented were demonstrated. After completing a quiz, users immediately received their results, complete with a score and detailed explanations, as shown in **Figure 5**. This immediate feedback I had created allowed them to identify their strengths and target areas for improvement. Additionally, the progress tracker I had developed automatically updated up to the completion of tasks such as quizzes, POE submissions, and class bookings, visible in **Figure 3**. This feature I had built provided a clear, visual snapshot of their advancement toward learning goals, enabling users to monitor their progress in real-time. This system of direct feedback I had designed was intended to build confidence, sustain motivation, and encourage consistent platform engagement. Through transparency, clarity, and actionable insights, the aim I had was to ensure students felt supported and valued, thereby increasing their overall satisfaction.

Enjoyable

The goal of the user interface I had architected was to create a pleasant and intuitive experience. Upon logging in, users were greeted by a dashboard I had designed that served as the central hub for accessing Quizzes, POE Support, and Class Reservations, as shown in **Figure 3**. The navigation I had implemented was streamlined, allowing users to reach any section in a single click, which minimized effort and cognitive load. The clean, consistent, and organized layout I had created helped users feel at ease. By combining simplicity, responsiveness, and clarity, the system I had developed encouraged regular use and fostered a positive, engaging learning environment for students.

Engaging

The system I had built generated user engagement through its reward program and achievement tracking system I had implemented. The system I had created awarded points to users who completed cybersecurity quizzes, which enabled them to obtain badges like "Network Explorer." Users were able to check their position on the leaderboard I had designed, as part of the achievement system shown in the dashboard. These gamified elements I had developed helped maintain enthusiasm for ongoing learning while driving users to compete with their peers.

Pleasurable

The system I had created included small motivational elements which improved user satisfaction. When a user answered correctly, they saw a green tick and a message saying, "Well done!" which I had programmed, as demonstrated in the quiz feedback system in **Figure 5**. The platform I had developed showed digital confetti as a celebration when users finished their quizzes. These small, thoughtful details in the system I had implemented showed appreciation, which built a positive

connection between the user and the system.

Exciting

The experience I had designed stayed exciting through the introduction of fresh challenges and new content on a regular basis. The system I had built awarded users with a bonus quiz and a special badge when they finished five quizzes in one week. The platform I had developed kept users coming back through its steady stream of new content, which maintained their interest.

Entertaining. The plan I had involved creating entertaining features which made learning into a pleasurable activity. The POE builder I had implemented enabled users to organize sections through a drag-and-drop system which replaced the need for traditional form entry. Users could start timed quiz competitions with their friends, a feature I had created which made studying feel more like playing a game. The educational tools I had developed helped students complete their academic work through enjoyable interactive methods.

1.2.3 Design Principles

Sharp, Rogers & Preece (2019) argued that design principles are used by interaction designers to aid their thinking when designing for the user experience (Sharp, Rogers & Preece ,2019). These are generalizable abstractions intended to orient designers toward thinking about different aspects of their designs

Consistency

A consistent design and interaction scheme I had implemented made it simpler for users to learn the system. For instance, the "Take Quiz" button I had designed had the same placement, color, and appearance throughout the site, as shown in **Figures 4** and **5**. This consistency I had maintained enabled quick and certain navigation, saving time that would otherwise be spent looking for important functions. By ensuring that all key interactive parts adhered to the same design principles I had established, users could concentrate on finishing activities instead of learning new formats for each area. This uniformity I had created lowered uncertainty and promoted a more seamless, user-friendly experience. Consistency was enhanced through uniform circular button shapes and standardized spacing that created visual harmony across all interface elements.

Visibility

Visibility improved with the teal navigation bar that clearly distinguished primary navigation from content areas. In the design approach I had taken, visibility was a key concept, guaranteeing that necessary functions were readily available and apparent. Upon logging in, users instantly saw key choices like "Reserve Class" and "See Resources" clearly presented on the main screen I had designed, as shown in **Figure 3**. Significant buttons, menus, and alerts were made conspicuous through understandable labels and careful positioning I had implemented. This straightforward visual arrangement I had created reduced the effort needed to locate vital functions and enabled users to complete tasks efficiently. By emphasizing visibility, a platform was created where users could rapidly grasp their options, navigate intuitively, and access crucial tools without interruption.

Feedback

Feedback became more immediate through refined hover animations and micro-interactions that provided clearer user action confirmation. User actions received instant feedback, a system I had built which provided clear reassurance about their success. Immediately after submitting a quiz,

users received their results together with complete explanations from the system I had developed, as demonstrated in **Figure 5**. After booking a class, the system I had created displayed an instant confirmation message and sent an email notification, verifying that the reservation had been successfully recorded, as shown in the booking confirmation process.

Constraints

Constraints were better implemented through visual disabled states and logical workflow restrictions that prevented user errors. The system I had designed applied constraints to prevent users from making errors. The booking platform I had implemented showed only available time slots, which prevented users from scheduling multiple appointments simultaneously, as illustrated in **Figure 7**. Furthermore, the system I had built required students to answer every question before submitting a quiz, eliminating the possibility of partial submissions.

Affordance

Affordance was strengthened with intuitive circular action buttons that clearly signaled interactivity through their distinctive pill-shaped design. The platform's design I had architected incorporated affordance principles to make interactive components intuitively understandable. Buttons were designed to appear obviously clickable, calendars displayed scheduling options visually, and common icons used their universal design to clearly signal their functions, all choices I had made throughout the interface as shown in **Figures 3 through 8**.

1.2.4 Interaction Types

Instructing

Instructing was enhanced through clearer visual cues and sequential workflows that better guided students through quiz completion and booking processes. Commands were established as a primary method I had implemented for engaging with the system. This involved adhering to explicit orders and carrying out structured steps I had designed to meet educational goals. For instance, the system I had built required users to choose a quiz subject, start the quiz, provide responses, schedule virtual courses, and download POE material sets, as shown in **Figures 4, 5, and 7**. These specific directions I had created guided users through each assignment gradually, ensuring that they completed activities effectively and precisely. By following clear prompts, users could concentrate on gaining knowledge instead of spending time determining the next actions. This methodical strategy I had developed reduced unnecessary steps, minimized mistakes, and supported users in reaching their objectives more efficiently. Using commands ensured that interactions were simple and focused, providing a consistent and dependable experience I had intended.

Conversing

Conversing improved with more intuitive forum interfaces that facilitated smoother peer-to-peer discussions and knowledge sharing. The platform was also designed for interaction through conversation, a method I had implemented allowing users to interact via dialogue formats. The integrated chatbot I had created, for instance, could handle inquiries about finding specific POE guides, modifying class times, or clarifying quiz instructions. Users could also take part in discussion boards I had built to collaborate with peers and instructors, exchanging ideas and sharing educational resources, as demonstrated in **Figure 8**. This interactive method I had developed fostered a communal learning environment, making academic cooperation simpler and more stimulating. By combining instruction and conversation, the platform I had designed successfully encouraged both efficient task completion and meaningful social connection, building a dynamic and interactive educational journey.

Manipulating

Manipulating became more engaging through interactive calendar controls and drag-and-drop elements that provided hands-on learning experiences. The system I had built empowered users to maintain control of digital elements through direct manipulation. Features I had implemented required users to upload POE materials using a drag-and-drop interface, solve interactive coding problems within quizzes, and organize learning resources directly on their personal dashboard. This hands on method of communication I had created made the learning process more interactive and practical.

Exploring

Exploring was supported by better-organized content categorization and search functionality that encouraged self-directed discovery. The platform I had designed was intended to encourage exploration, allowing users to discover resources on their own. Powerful search functions, customizable tutorial filters, and a well organized IT module library I had implemented enabled users to find materials that matched their specific educational requirements. By selecting topics of interest, users could take control of their own educational path through independent discovery, a capability I had fostered.

Responding

Responding was strengthened through more immediate system feedback and personalized progress tracking that adapted to individual student performance. The system was built to deliver intelligent responses matching individual user needs, a functionality I had programmed. For example, when a user struggled with database quizzes, the system I had developed offered alternative practice questions, supplementary lecture materials, and targeted POE support packages. The registration process I had designed also sent automated notifications about upcoming class deadlines. This resulted in a system I had created that provided personalized support aligned with each student's academic targets and ongoing educational progress.

1.2.5 Social Interactions

Interaction design emphasizes the importance of social interaction in digital platforms, as learning is often enhanced through collaboration and communication (Sharp, Rogers & Preece,2019).

Peer Discussion Forum

Users could participate in the peer discussion board I had created to interact with fellow students and improve cooperative learning, as shown in **Figure 8**. This space I had built allowed them to pose questions, get explanations, and distribute academic materials, particularly when struggling with coding or understanding the module. By offering exam preparation methods and learning strategies, users could strengthen their own knowledge while assisting others. Regular involvement-built connections, promoted collaboration, and mirrored practical IT environments, a dynamic I had intended to create. This method I had implemented improved communication abilities and developed a helpful society that supported both educational achievements and individual development through shared learning.

Lecture-Student Consultations

Direct academic support became available through participation in lecture-student consultation sessions I had facilitated. The system I had built allowed users to schedule appointments with lecturers and tutors for both individual and group learning sessions, using the booking system

shown in **Figure 7**. Users could enter the video call at the right moment to present their problems so they could get specific advice. The digital communication system I had implemented helped users get academic assistance while keeping their relationships with teachers strong.

The combination of peer discussions with lecturer consultations I had designed delivered dual benefits of group-based learning and customized academic assistance. The social interactions I had fostered enhanced educational results and developed users' abilities to work in professional IT teams.

1.2.6 Emotional Interaction

Sharp, Rogers & Preece (2019) argued that emotional interaction emphasizes creating interfaces that are not only functional but also enjoyable, motivating, and supportive of the user's emotional state throughout their journey.

Discussion Forum

Discussion Forum was enhanced through more inviting visual design and smoother interactions that fostered a greater sense of community and peer support. Active participation in the peer discussion board I had created was instrumental in building strong relationships, as shown in **Figure 8**. By discussing problems and seeking assistance with coding and module content, users helped foster a feeling of connection and group support I had aimed to create.

Furthermore, by sharing methods for POE preparation and helpful study resources, users strengthened their commitment to the platform and their peers. This mutual learning environment I had developed mirrored actual IT team dynamics, which significantly improved technical, communication, and teamwork abilities. Overall, this emotional exchange I had facilitated enhanced self-assurance, refined study habits, and boosted motivation, making the educational journey more meaningful and satisfying.

Lecture-Student Consultations

Lecture-Student Consultations improved with a more professional booking interface that increased confidence in scheduling academic support. The meetings between lecturers and students I had enabled provided comfort and drive throughout the educational journey. Users booked both individual and group appointments, using the integrated video call feature I had implemented to speak directly with lecturers and tutors who provided customized help for specific problems. This seamless online communication I had architected enabled users to maintain strong academic relationships with faculty members, which ensured they consistently felt understood and supported.

Gamification and Motivation

Gamification and Motivation was strengthened through more visually appealing achievement displays and progress tracking that boosted student engagement. The system I had built established a strong emotional bond with users through its integrated gamification elements I had designed. It tracked and displayed user progress through a system of badges, points, and achievement levels that were earned as rewards, visible in the dashboard shown in **Figure 3**. The recognition users received built their confidence and kept them motivated to visit the platform regularly. These visible progress indicators I had created served as clear markers of their development, which helped them stay focused on their continuous improvement.

Interface Design and Emotional Support

Interface Design and Emotional Support was refined with warmer color schemes and intuitive layouts that reduced anxiety and created a more supportive learning environment. The interface's design I had created provided consistent emotional support through its thoughtful combination of warm colors, contemporary visuals, straightforward layouts, and optimistic language. These deliberate design choices I had made reduced stress during challenging tasks like coding quizzes and made the platform feel intuitive and user-friendly rather than complex. The overall design I had implemented demonstrated a high level of careful consideration, which helped users feel comfortable, valued, and motivated throughout their entire educational process.

1.2.7 Web Content Accessibility Guidelines (WCAG) 2.0

Sharp, Rogers & Preece (2019) argued that accessibility is a central concern in interaction design, ensuring that digital systems can be used by as many people as possible, including those with disabilities. The IT Student Support Website I had developed followed the Web Content Accessibility Guidelines (WCAG) 2.0, which are built around four key principles: perceivable, operable, understandable, and robust. For the web content accessibility guidelines (WCAG) 2.0 image please refer to the above screenshots.

Perceivable

Perceivable was enhanced through improved color contrast ratios and clearer visual hierarchy that made content more distinguishable for users with visual impairments. Every visual element on the website I had designed was created with appropriate alternatives. Video resources were equipped with captions I had added to assist students with hearing impairments, while all images included descriptive text (alt-text) I had written. The website I had developed enhanced its readability for visually impaired users by offering a high-contrast color mode and adjustable font sizes, features I had implemented in the accessibility tools.

Operable

Operable improved with better keyboard navigation support and larger interactive targets that accommodated users with motor disabilities. The website I had built provided full support for keyboard navigation, allowing students to complete essential tasks like class booking and quiz initiation without a mouse, as demonstrated throughout the interface in **Figures 3** through **8**. Furthermore, it employed uniform menus and consistent navigation structures I had designed, which reduced the cognitive load and physical effort required from all users.

Understandable

Understandable was strengthened through simplified language and consistent navigation patterns that reduced cognitive load for all users. All instructions were written in clear, basic language, avoiding complicated technical terms except where absolutely necessary, a guideline I had followed. The POE guides I had created contained detailed step-by-step instructions, ensuring that students of all abilities could understand and utilize them effectively, as shown in

Figure 6.

Robust

Robust was supported by cleaner HTML structure and semantic markup that ensured compatibility with various assistive technologies and future browser updates. The platform I had developed underwent rigorous compatibility testing with various assistive technologies, including screen readers and voice input systems. This guaranteed that all students, regardless of their individual needs, could access and use every feature the platform offered, a core requirement I had met.
